WPI; 2002-351711/38. N-PSDB; AAD35513 Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon

Claim 17; Page 144-145; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopertenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and asteaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in

```
ö
the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii phytoene synthase (CrtB) enzyme used in the

Ö
adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtB, crtB, crtY, crtZ, crtX, crtX, crtX, crtX, crtX, or crtW, are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucosides, adonixanthin-3'-carotenoid glucosides are used as food additives. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes the production of a vegetable component in an animal in which a gene participating in the synthesis of a vegetable component is introduced to an animal and expressed in the animal. Also described is the preparation of an oxidative stress-resistant animal in which a gene participating to the synthesis of a vegetable component having antioxidative activity, anti-lipid oxidative activity, cancer preventive activity or cancer growth inhibiting activity is introduced to

Brwinia herbicola phytoene synthase (AAW16492) catalyses the biosynthesis of phytoene, a precursor of the red carotenoid lycopene, from geranylgeranyl pyrophosphate. Its expression in transgenic plant material can be utilised as a means of visually distinguishing such material from non-transgenic cells and tissues. Novel binary vector ps70203 (ATCC 97282) includes an expression cassette comprising the tomato EB promoter (see also AAT66533), a plastid targetting signal (AAT66535) fused to the phytoene synthase gene (AAT66534), and a 3' non-translated region (AAT66536). Transgenic plant cells and tissues are identified by the appearance of orange colour. (Updated on 17-0CT-2003 to standardise OS

The invention specifically describes the isolation of a 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase protein. This sequence represents the Candida utilis crtB protein which is used in the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

AAQ13716, AAQ13718, AAQ13719, AAQ13722, AAQ13724 and AAQ13726 respectively. Recombinant expression plasmids can be used to produce tlarge amies. of the enzymes and hence large amies. of the carotemoids which they synthesise. Carotemoids are pigments with a variety of applications. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    N-PSDB; AAT40791
                                                                                                                                                                                                                                  Sequence 308 AA;
```

```
Increasing prodn. of total carotenoid(s) in a higher plant - by transforming with vector encoding chloroplast transit peptide operably linked to the Erwinia herbicola lycopene cyclase structural gene.
```

Example 4; Fig 4; 99pp; English

The present sequence is that of the Erwinia herbicola phytoene synthase which acts on geranylgeranyl pyrophosphate (GGPP) (produced by the action of GGPP) and isopenternyl pyrophosphate and dimethylallyl pyrophosphate). GGPP is a 20-carbon atom precursor of phytoene, the first carotenoids in a plant can be increased by transforming the plant with DNA encoding enzymes involved in the biosynthesis pathway, in particular the lycopene cyclase gene (AAT40795). Lycopene is prepared biosynthetically from phytoene through four sequential dehydrogenation reactions which can be carried out by a single dehydrogenase (AAT40793) in Erwinia sp. Beta- carotene is produced by the tobacco ribulose bis-phosphate carboxylase-oxygenase gene (See AAT40794) is operatively linked in frame to the 5' end of the lycopene cyclase structural gene. This leads to increased production of total carotenoids in the chloroplast of transformed plants as compared to native, non-transformed plants of the same type. Beta-carotene is an effective and apparently harmless food colourant and is also in the pathway for biological synthesis of further C40 carotenoids such as zeaxanthin and zeaxanthin diglucoside. ```
This sequence represents Erwinia herbicola phytoene synthase encoded by plassing places. This sequence represents Erwinia herbicola phytoene synthase is an enzyme which is involved in the biosynthesis of carotenoids, esp. lycopene, from the ubiquitous of carotenoids, esp. lycopene, from the ubiquitous been grecursor, farmesyl pyrophosphate. In E. herbicola, phytoene has been found to be formed blosynthetaically in a two-step process. The initial step is the condensation of farmesyl pyrophosphate (PPP) and isopentyl pyrophosphate. This first step is immediately followed by a tail to tail phytoene. Lycopene is produced from phytoene by the catalytic action of phytoene dehydrogenase. Has produced from phytoene by the catalytic action of phytoene dehydrogenase. He lycopene commercial production of lycopene which is used as a food colourant. Plant transformed with the phytoene dehydrogenase. He coding sequence are protected from the herbicide norflurazon. (Updated on 25-MAR-2003 to correct PF field.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes wild type phytoene synthase. Phytoene synthase is an enzyme which, along with geranylgeranyl pyrophosphate (GGPP) synthase (see also AAT41741.42), catalyse the formation of carotenoids, particularly phytoene. An N-terminally truncated form of GGPP synthase which has the first thirteen amino acids replaced by four heterologous amino acids derived from the plasmid pARG16A was found to be about twice as active as the wild type enzyme. A C-terminal truncated protein was so active as the wild type enzyme. A C-terminal truncated protein was found to have even higher activity and was cloned into plasmid pARG489D. The phytoene synthase coding sequences may be attached to the transit peptide coding sequence given in AAT41744, for transport into tobacco chloroplasts. This allows the tobacco plants to produce high levels of phytoene for use in the treatment of skin disorders. (Updated on 25-MAR-2013) to correct PP field.) (Updated on 16-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transformed plants containing DNA encoding Erwinia herbicola enzymes - esp. geranyl:geranyl pyrophosphate synthase and phytoene synthase, allows large scale production of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              133

The DNA molecule comprises at least 1125 bp and is present in the plasmids pARC1470, pARC1510, pARC1510 and pARC1520. The present sequence represents amino acid corresponding to the structural gene for phycoene synthase. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carotene levels. Beta-carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 25-mark-2003 to correct PF field.) Danchin A; Kunst F, Frangeul L, Glaser P, Taourit S, Duchaud E, The Buchrieser C; Genomic sequence of Photorhabdus luminescens and encoded polypeptides useful e.g. as therapeutic antimicrobials and agricultural pesticides

WPI; 2003-148459/14.

Claim 2; SEQ ID NO 3221; 1205pp; French.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           193 HOBGLMPDTLIYTENRPALARVASRLIVEAESYYTSALTGLVGLPLRSAWVIASAHGIYR 252
              genes, proteins, vectors containing the genes and Ab are also useful therspeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of funan diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                     72

                                                                 Š
                       FUNCTION: This enzyme converts phytoene into lycopene via the intermediaries of phytofluene, zeta-carotene and neurosporene the introduction of four double bonds (By similarity). CCFACTOR: FAD (Probable).

PATHWAY: Carotenoid biosynthesis, Involved in astaxanthin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ProDom; PD139017; Phytn dehydro; 1.

Bartley G. E., Schnidhauser T.J., Yanofsky C., Scolnix P.A.;
Carotenoid desaturases from Rhodobacter capsulatus and Neurospora crassa are structurally and functionally conserved and contain domains homologous to flavoprotein disulfide oxidoreductases.";
J. Biol. Chem. 265:16020-16024(1990).
J. FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ŝ
                                                                                                                                                                                                                                                                      -!- COFACTOR: FAD (Probable).
-!- PATHWAY: Carotenoid and chlorophyll biosynthesis.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 1; Length

                                          sphaeroides 2.4.";
Nucleic Acids Res. 28:862-867(2000).
-!- FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
-!- COFACTOR: PAD (Probable).
Choudhary M., Kaplan S.; nDNA sequence analysis of the photosynthesis region of Rhodobacter

A cluster of structural and regulatory genes for light-induced carotenogenesis in Myxococcus xanthus.";

Full 1. Biochem. 233:238-248(1995);

Full 1. FUNCTION: This enzyme converts phytoene into zeta-carotene via tintermediary of phytofluene by the symmetrical introduction of identified bonds at the C-11 and C-11' positions of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Carotenoid biosynthesis; Oxidoreductase; FAD; Flavoprotein; NAD

".

Mol. Gen. Genet. 252:658-666(1996).

-!- FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -1- COFACTOR: FAD (Probable).
-1- PATHWAY: Carotenoid biosynthesis.
-1- SIMILARITY: Belongs to the phytoene dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bacteria; Actinobacteria; Actinobacteridae; Actinomycetales;

-!- COFACTOR: RAD (Probable).
-!- PAITHWAY: Carotenoid biosynthesis.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.

Pontes M., Ruiz-Vazquez R.M., Murillo F.J.;

Forovth phase dependence of the activation of a bacterial gene for carotenoid synchesis by blue light.";

EMBO J. 12:1265-1275(1993).

-!-FUNCTION: This enzyme convexts phytoene into lycopene via the intermediaries of phytofluene, zeta-carotene and neurosporene the introduction of four double bonds (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       36;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -!- PATHWAY: Carotenoid biosynthesis.
-!- INDUCTION: By blue light.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bacteria; Proteobacteria; Deltaproteobacteria; Myxococcales;
Cystobacterineae; Myxococcaceae; Myxococcus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Carotenoid biosynthesis; Oxidoreductase; FAD; Flavoprotein; NP BIND 12 45 FAD (ADP PART) (POTENTIAL).     -!- PATHWAY: Carotenoid biosynthesis.
    -!- SIMILARITY: Belongs to the phytoene dehydrogenase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ruiz-Hidalgo M.J.;
Submitted (MAR-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: This enzyme converts phytoene into zeta-caroter
interamediary of phytofluene by the symmetrical introducti
double bonds at the C-11 and C-11' positions of phytoene.
-!- COFACTOR: FAD (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-OCT-1996 (Rel. 34, Created)

"Isolation, sequence, and characterization of the Cercospora
nicotianae phyrocene dehydrogenase gene."
Appl. Brwizon. Microbiol. 60:2766-2771(1994).
-!- FUNCTION: This enzyme converts phytoene into zeta-carotene via the
intermediary of phytofluene by the symmetrical introduction of two
double bonds at the C-11 and C-11' positions of phytoene.
-!- COFACTOR: FAD (Probable).
-!- PATHWAY: Carotenoid biosynthesis.
                                                                                                                                                                                                                                                                        62 AIEELFALAGKOLKDYVELLPVTPFYRLCWESGKVFNYDNDQAQLEAQIQQFNPRDVAGY

METHOXYNBUROSPORENE TO SPHEROIDENE O
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CRID.

Rhodobacter capsulatus (Rhodopseudomonas capsulata).

Rhodobacteria; Proteobacteria; Alphaproteobacteria; Rhodobacterales; Rhodobacteraceae; Rhodobac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         COFACTOR: FAD (Probable).
PATHWAY: Carotenoid and chlorophyll biosynthesis.
SIMILARITY: Belongs to the phytoene dehydrogenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-AUG-1990 (Rel. 15, Created)
